

Karmex® DF

only by DuPont

Broad-spectrum weed control in industrial and non-crop settings

Karmex® DF combines excellent weed control with cost-effectiveness.

Karmex® DF is a great choice for industrial vegetation management programs where bare ground is desired.

- Effective pre-emergent and early post-emergent control
- Dry-flowable formulation is easy-to-use, measure and pour
- Flexible rates allow you to target the weed species present and adjust the length of residual control desired

Application Rates and Timing

Karmex® DF may be applied at any time, except when the soil is frozen. Moisture is required to activate and fix the product in the soil. For best results, make applications just prior to the period when weed growth is expected to begin. Use lower rates for sandy soil and when short duration weed control is required. Refer to the label for complete product details.

The actual rates required to control most weeds for an extended period of time vary depending on soil type, weed species present and duration of control a desired. Karmex® DF controls many annual and perennial grasses plus dandelion, goldenrod, thistle and milkweed.

The lower rate within the respective soil classifications should be used where annual weeds predominate and where one season's control is desired.

Where perennial weeds predominate and where more than one season's control is required, use the higher rates.

Environmental Summary

Diuron, the active ingredient in Karmex® DF, is absorbed readily by soil containing organic matter and/or clay and has low solubility in water. The primary means of degradation is through metabolism by soil microbes.
